ACCIDENTAL (UNINTENTIONAL INJURY) DEATHS, ARIZONA, 1994-2004

KEY FINDINGS

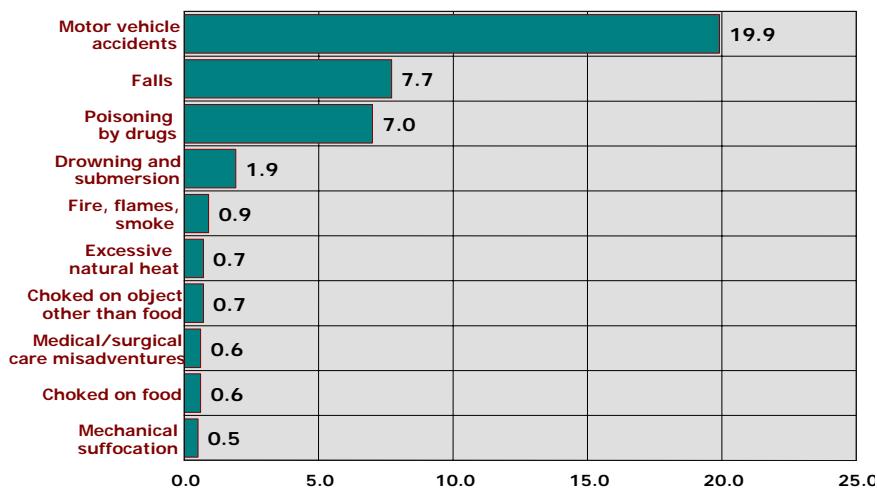

Figure 2-1
**Age-Adjusted Mortality Rates for Accidents
 (unintentional) Injury by Gender and Year,
 Arizona, 1994-2004**

In 2004, there were 2,641 unintentional injury deaths among the residents of Arizona, compared to 1,879 in 1994 (**Table 2-1**). However, the 2004 age-adjusted mortality rate for accidental (unintentional) injuries changed very little from the 1994 rate for both genders (46.0 and 46.5 deaths per 100,000 population, respectively, **Figure 2-1**).

The age-adjusted mortality rate for unintentional injuries among males decreased for the 3rd consecutive year to 61.1 deaths per 100,000, respectively). (**Figure 2-1**). In contrast, the 2001-2004 mortality rates for unintentional injuries among females were higher than the annual rates seven earlier years. In fact, the 2004 female mortality rate was the highest rate of the eleven-year period from 1994 to 2004.

Figure 2-2
**Average Annual* Mortality Rates for Leading Causes of
 Accidental (unintentional) Injury, Arizona, 1994-2004**

The leading causes of accidental (unintentional) injury are the ten causes with the greatest number of deaths over the 1994-2004 period. *Motor vehicle accidents* (10,796 deaths), followed by *falls* (4,163), *poisoning by drugs, medicaments and biological substances* (3,813), *drowning and submersion* (957), and *exposure to smoke, fire and flames* (479) have remained the top five leading causes of accidental injury death in Arizona (**Figure 2-2, Table 2-1**), as they were in 1990-2000.

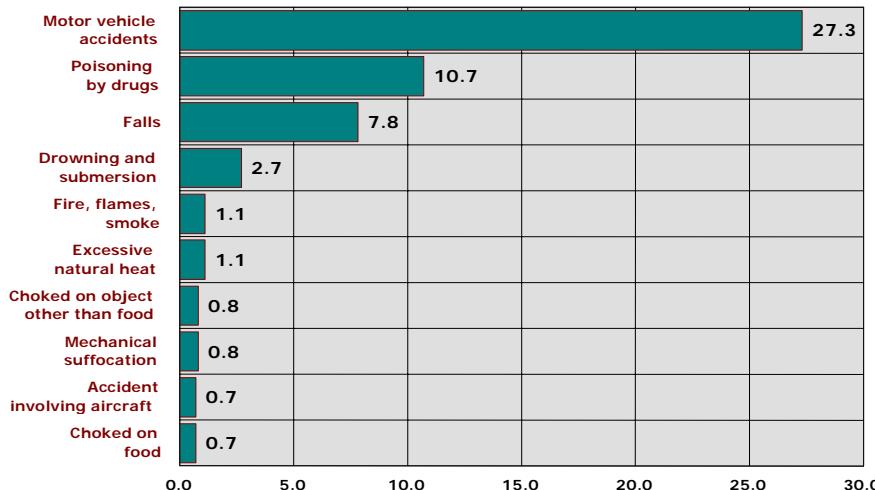

Exposure to excessive natural heat (387 deaths), was the sixth leading cause of unintentional injury death, followed by *choking on object other than food* (382) *misadventures to patients during medical/surgical care* (347), *choking on food* (325) and *mechanical suffocation* (282).

ACCIDENTAL (UNINTENTIONAL INJURY) DEATHS, ARIZONA, 1994-2004 KEY FINDINGS

Males accounted for 68.4 percent of all death in motor vehicle accidents (7,382 out of 10,796). In 1994-2004, the average-annual death rate for *motor vehicle accidents* among Arizona males was 2.2 times greater than that for females (**Figure 2-3, Figure 2-4, Tables 2-2 and 2-3**). *Poisoning by drugs* ranked second for males, but third for females. In contrast, deaths from *falls* ranked second for females, but third for males. The fourth and fifth causes of accidental injury death – *accidental drowning and submersion* and *fire, flames and smoke*, were the same for both males and females.

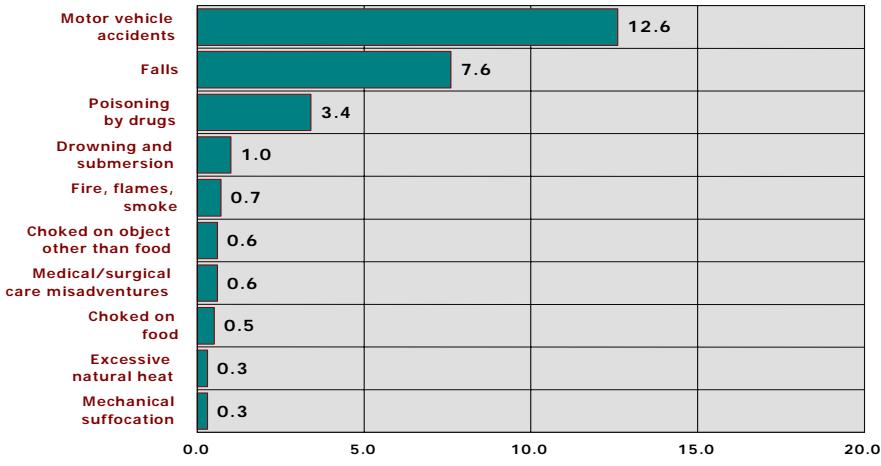

Choking on objects other than food was the sixth leading cause of accidental injury death among females (**Figure 2-4**). *Exposure to excessive natural heat* ranked sixth for males, but ninth for females. *Misadventures during surgical and medical care* were the seventh cause of accidental injury death for females, but they were not ranked in the top 10 for males. In contrast, *accidents involving aircraft* (195 deaths in 1994-2004) were among the leading causes of injury death for males, but not females (**Figure 2-3**). All types of accidents combined accounted for 7,968 deaths among females in 1994-2004, compared to 16,493 male deaths during that period (**Table 2-2, Table 2-3**).

Figure 2-3
Average Annual *Mortality Rates for Leading Causes of Accidental (unintentional) Injury Among Males, Arizona, 1994-2004

*Number of deaths from specified cause per 100,000 population per year from 1994 to 2004. The rates were computed using an 11-year total number of deaths for 1994-2004. The 1999 population figures (i.e., population at mid-point) multiplied by eleven were used as the denominators.

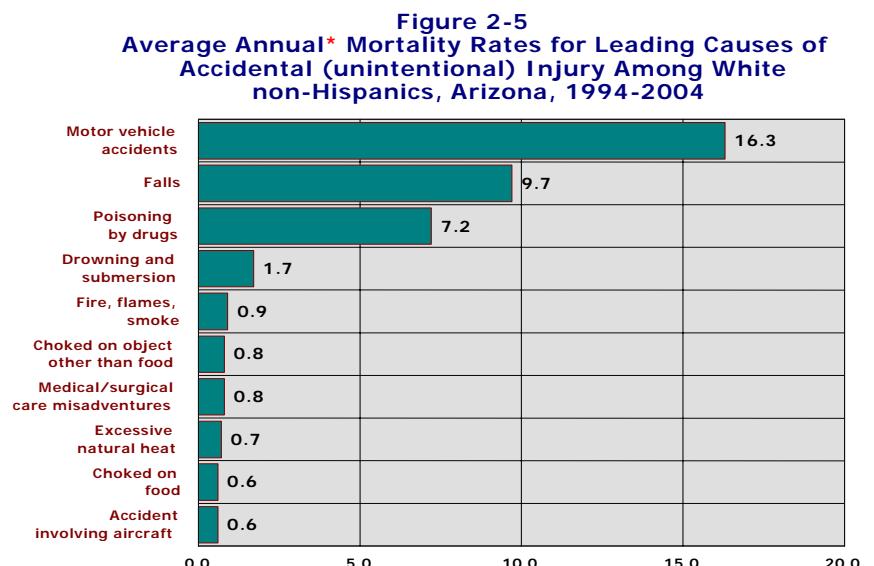

Figure 2-4
Average Annual *Mortality Rates for Leading Causes of Accidental (unintentional) Injury Among Females, Arizona, 1994-2004

*Number of deaths from specified cause per 100,000 population per year from 1994 to 2004. The rates were computed using an 11-year total number of deaths for 1994-2004. The 1999 population figures (i.e., population at mid-point) multiplied by eleven were used as the denominators.

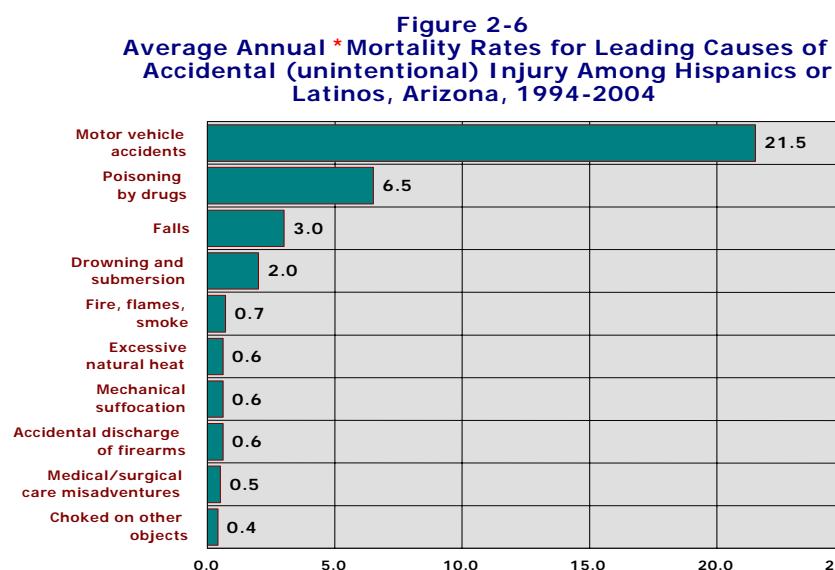

ACCIDENTAL (UNINTENTIONAL INJURY) DEATHS, ARIZONA, 1994-2004

KEY FINDINGS

*Number of deaths from specified cause per 100,000 population per year from 1994 to 2004. The rates were computed using an 11-year total number of deaths for 1994-2004. The 1999 population figures (i.e., population at mid-point) multiplied by eleven were used as the denominators.

Among White non-Hispanic residents of Arizona, the average annual mortality rate for *motor vehicle crashes* (16.3 deaths per 100,000) was 9.6 times greater in 1994-2004 than the rate for *drowning* (1.7/100,000). During 1994-2004, *choking on food* posed the same mortality risk as *accidents involving aircraft* (0.6/100,000; **Figure 2-5**). The number of fatal *drug overdoses* among White non-Hispanics increased 2.7 times from 145 deaths in 1994 to 390 deaths in 2004 (**Table 2-10**). The number of deaths from *falls* more than doubled from 204 in 1994 to 453 in 2004.

*Number of deaths from specified cause per 100,000 population per year from 1994 to 2004. The rates were computed using an 11-year total number of deaths for 1994-2004. The 1999 population figures (i.e., population at mid-point) multiplied by eleven were used as the denominators.

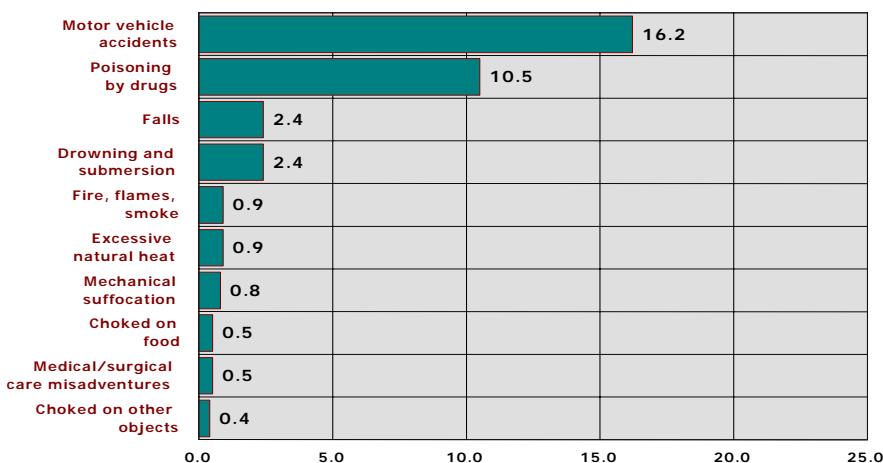

The leading cause of unintentional injury death among Hispanic or Latino residents of the State were *motor vehicle accidents* which accounted for 54.5 percent of all accidental fatalities in this group in 1994-2004 (**Figure 2-6, Table 2-11**). The average annual motor vehicle fatality rate of 21.5 deaths per 100,000 Hispanics per year was the second highest rate among the race/ethnic groups.

ACCIDENTAL (UNINTENTIONAL INJURY) DEATHS, ARIZONA, 1994-2004

KEY FINDINGS

The average annual mortality rate for accidental poisoning by drugs among Blacks or African Americans (**Figure 2-7**) was the highest rate among the race/ethnic groups at 10.5 deaths per 100,000 population. Drug overdoses accounted for 25.9 percent of all fatal unintentional injuries in this group between 1994 and 2004 (**Table 2-12**). The drowning rate of 2.4 per 100,000 Blacks or African Americans was the second highest rate among the race/ethnic groups in the State.

Figure 2-7
Average Annual* Mortality Rates for Leading Causes of Accidental (unintentional) Injury Among Blacks or African Americans, Arizona, 1994-2004

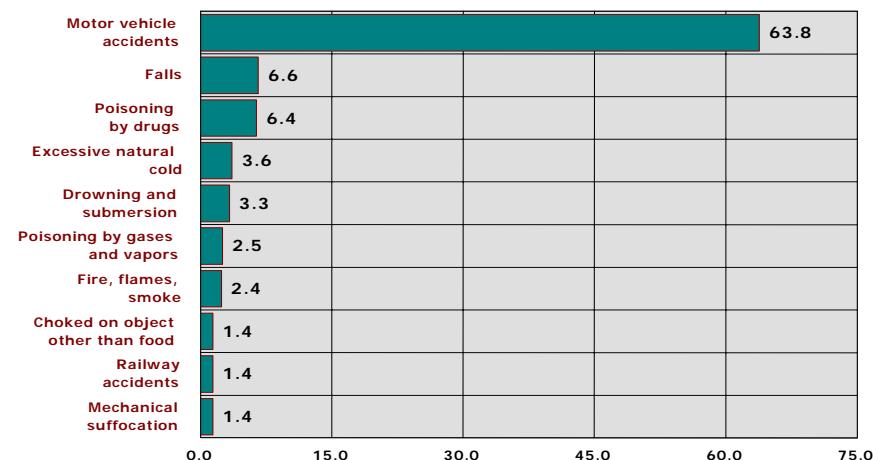

*Number of deaths from specified cause per 100,000 population per year from 1994 to 2004. The rates were computed using an 11-year total number of deaths for 1994-2004. The 1999 pc figures (i.e., population at mid-point) multiplied by eleven were used as the denominators.

Excessive natural cold ranked fourth among the leading causes of unintentional injury death for American Indian residents of Arizona (**Figure 2-8, Table 2-13**), but it did not rank in the top five for any other race/ethnic group. During 1994-2004, 105 deaths of American Indians were attributed to exposure to cold (**Table 2-13**).

Mortality rates of American Indians for both motor vehicle accidents and drowning were the highest rates among the race/ethnic groups.

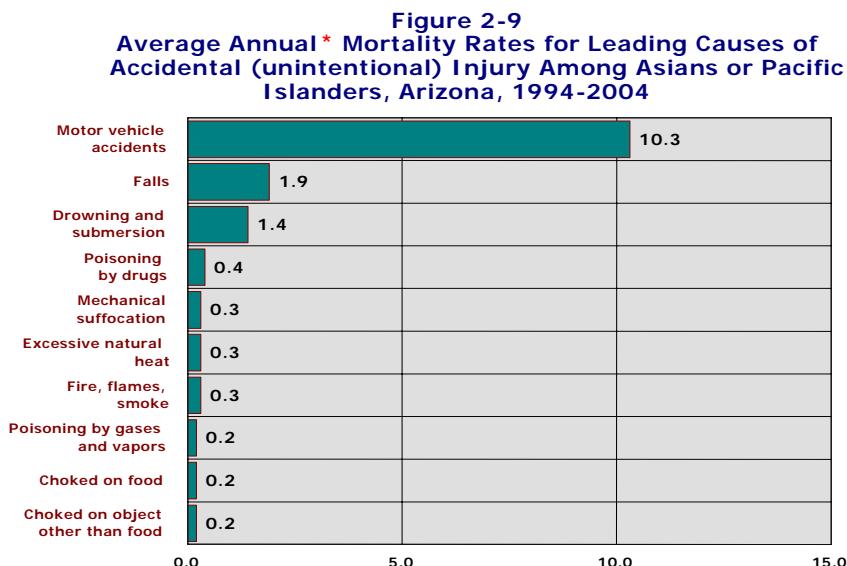

Figure 2-8
Average Annual* Mortality Rates for Leading Causes of Accidental (unintentional) Injury Among American Indians, Arizona, 1994-2004

*Number of deaths from specified cause per 100,000 population per year from 1994 to 2004. The rates were computed using an 11-year total number of deaths for 1994-2004. The 1999 pc figures (i.e., population at mid-point) multiplied by eleven were used as the denominators.

ACCIDENTAL (UNINTENTIONAL INJURY) DEATHS, ARIZONA, 1994-2004

KEY FINDINGS

*Number of deaths from specified cause per 100,000 population per year from 1994 to 2004. The rates were computed using an 11-year total number of deaths for 1994-2004. The 1999 population figures (i.e., population at mid-point) multiplied by eleven were used as the denominators.

During 1994-2004, the cause-specific injury death rates of Asian or Pacific Islander residents of Arizona were the lowest rates among the race/ethnic groups. In the eleven years from 1994 to 2004, only 5 Asians died from poisoning by drugs (**Table 2-14**). Except for *motor vehicle accidents*, *falls* and *drowning*, the number of deaths for other unintentional injuries among Asians was too small to compute statistically reliable rates (the rates for *choking on food* and *choking on objects other than food* in **Figure 2-9** are based on only 2 deaths each during the eleven-year period from 1994 to 2004).

Figure 2-10
Comparison of Average Annual* Mortality Rates for the Five Leading Causes of Accidental (unintentional) Injury by Race/Ethnicity, Arizona, 1994-2004

Rank	Asian or Pacific Islander	American Indian or Alaska Native	Black or African American	Hispanic or Latino	White non-Hispanic
1	Motor vehicle accident 10.3	Motor vehicle accident 63.8	Motor vehicle accident 16.2	Motor vehicle accident 21.5	Motor vehicle accident 16.3
2	Fall 1.9	Fall 6.6	Poisoning by drugs 10.5	Poisoning by drugs 6.5	Fall 9.7
3	Drowning 1.4	Poisoning by drugs 6.4	Fall 2.4	Fall 3.0	Poisoning by drugs 7.2
4	Poisoning by drugs 0.4	Excessive natural cold 3.6	Drowning 2.4	Drowning 2.0	Drowning 1.7
5	Mechanical suffocation 0.3	Drowning 3.3	Fire, flames smoke 1.3	Fire, flames smoke 0.7	Fire, flames smoke 0.9

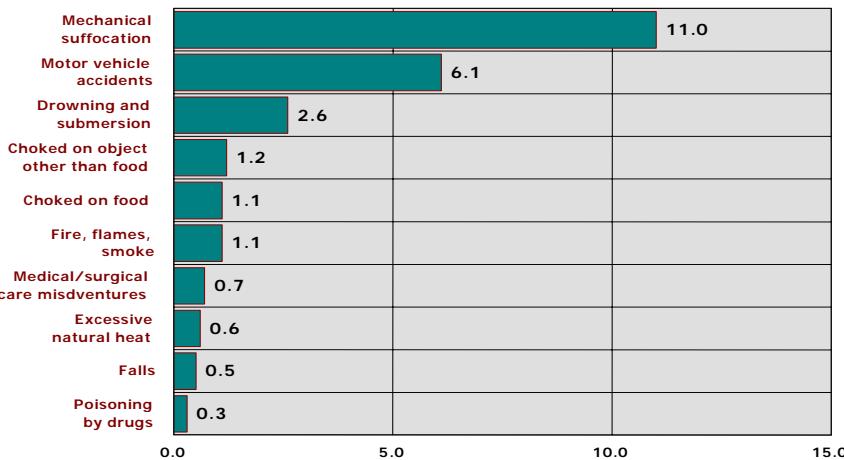

Number of deaths from specified cause per 100,000 population per year from 1994 to 2004. The rates were computed using an 11-year total number of deaths for 1994-2004. The 1999 population figures (i.e., population at mid-point) multiplied by eleven were used as the denominators.

Figure 2-10 shows variation across race/ethnic groups in the five leading causes of unintentional injury mortality. The race/ethnic groups share most of the leading causes in common (*motor vehicle accidents*, *poisoning by drugs*, *drowning*, *fire, flames and smoke*). For Asians, deaths due to *mechanical suffocation* ranked fifth, but they were not ranked in the top 5 for any other race/ethnic group. Deaths due to *excessive natural cold* ranked fourth for the American Indian population, but not ranked in the top 5 for the other racial/ethnic groups.

ACCIDENTAL (UNINTENTIONAL INJURY) DEATHS, ARIZONA, 1994-2004

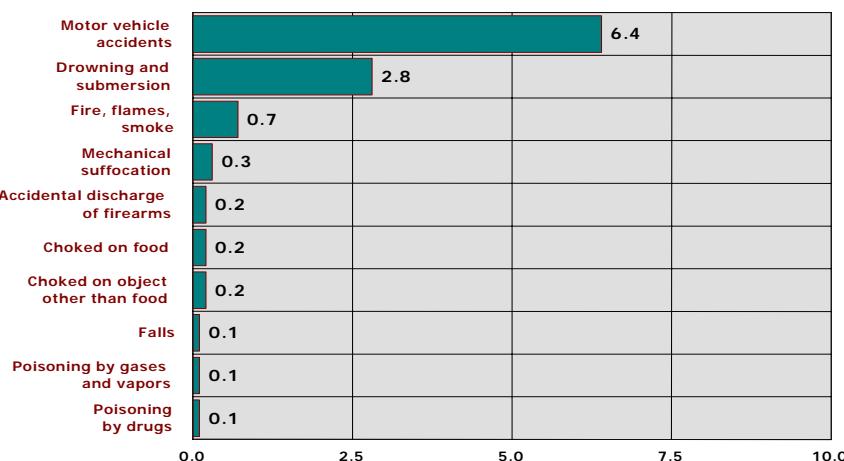

KEY FINDINGS

Figure 2-11
Average Annual* Mortality Rates for Leading Causes of
Accidental (unintentional) Injury Among Infants
(under 1 year), 1994-2004

*Number of deaths from specified cause per 100,000 births per year from 1994 to 2004.
The rates were computed using an 11-year total number of deaths for 1994-2004. The 1999 bi-figures (i.e., population at mid-point) multiplied by eleven were used as the denominators.

Figure 2-12
Average Annual* Mortality Rates for Leading Causes of
Accidental (unintentional) Injury Among Children
(1-14 years old), 1994-2004

*Number of deaths from specified cause per 100,000 population per year from 1994 to 2004.
The rates were computed using an 11-year total number of deaths for 1994-2004. The 1999 bi-figures (i.e., population at mid-point) multiplied by eleven were used as the denominators.

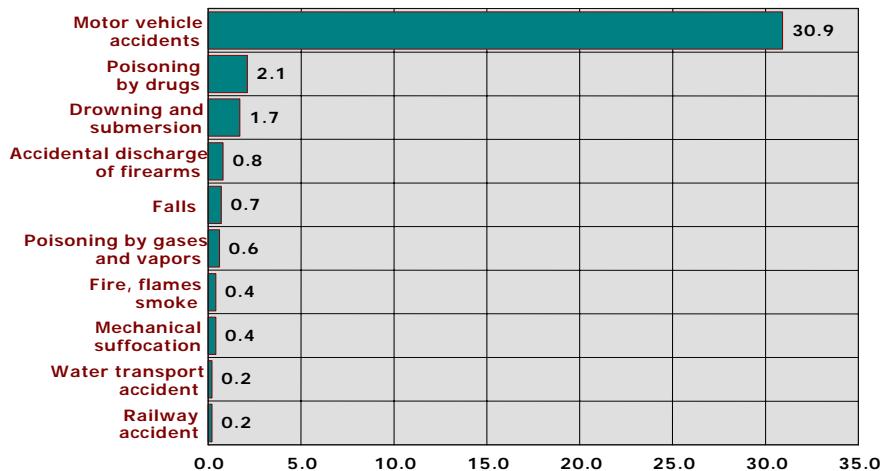

The top five causes of unintentional injury death among infants (<1 year of age) for 1994-2004 were *mechanical suffocation*, *motor vehicle accidents*, *accidental drowning and submersion*, *choking on object other than food*, and *choking on food* (Figure 2-11, Table 2-4). During 1994-2004, 5 infants died from exposure to excessive natural heat.

Among children 1-14 years old, the average annual mortality rate for *motor vehicle crashes* (6.4 deaths per 100,000) was 2.3 times greater in 1994-2004 than the rate for *drowning* (2.8/100,000), the second cause of unintentional injury. During 1994-2004, *accidental discharge of firearms* posed the same mortality risk as *choking on food* (0.2/100,000; Figure 2-12)

ACCIDENTAL (UNINTENTIONAL INJURY) DEATHS, ARIZONA, 1994-2004

KEY FINDINGS

Figure 2-13
**Average Annual * Mortality Rates for Leading Causes of
 Accidental (unintentional) Injury Among Adolescents
 (15-19 years old), 1994-2004**

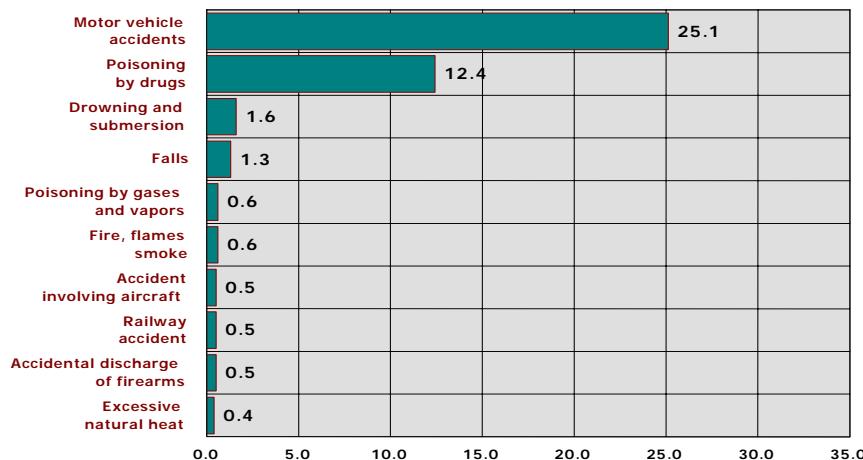

*Number of deaths from specified cause per 100,000 population per year from 1994 to 2004. The rates were computed using an 11-year total number of deaths for 1994-2004. The 1999 population figures (i.e., population at mid-point) multiplied by eleven were used as the denominators.

The leading cause of unintentional injury death among adolescents 15-19 years old were *motor vehicle accidents* which accounted for 77.3 percent of all accidental fatalities among Arizona adolescents in 1994-2004 (**Figure 2-13, Table 2-6**). The average annual motor vehicle fatality rate of 30.9 deaths per 100,000 adolescents per year was the highest rate among the age groups.

The number of adolescents who lost their lives in motor vehicle crashes (1,158 deaths in 1994-2004) was 15.0 times greater than the number of those who died from poisoning by drugs (77 deaths), the second leading cause of accidental death of Arizonans 15-19 years old in 1994-2004.

Figure 2-14
**Average Annual * Mortality Rates for Leading Causes of
 Accidental (unintentional) Injury Among Young Adults
 (20-44 years old), 1994-2004**

*Number of deaths from specified cause per 100,000 population per year from 1994 to 2004. The rates were computed using an 11-year total number of deaths for 1994-2004. The 1999 population figures (i.e., population at mid-point) multiplied by eleven were used as the denominators.

The average annual mortality rate for *accidental poisoning by drugs* among young adults 20-44 years old (**Figure 2-14**) was the highest rate among the age groups at 12.4 per 100,000 population. Drug overdoses accounted for 26.2 percent of all fatal unintentional injuries in this group between 1994 and 2004 (**Table 2-7**).

During 1994-2004, *accidental discharge of firearms* posed the same mortality risk as *railway accidents* or *accidents involving aircraft* (0.5 deaths per 100,000).

ACCIDENTAL (UNINTENTIONAL INJURY) DEATHS, ARIZONA, 1994-2004

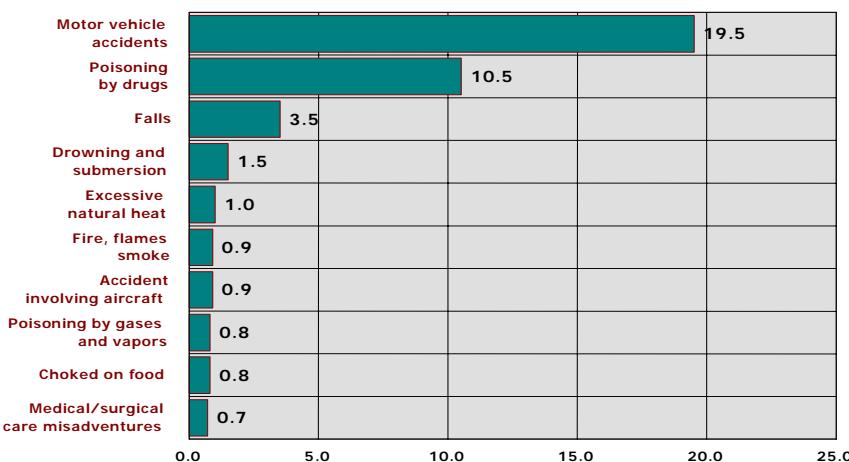

KEY FINDINGS

Excessive natural heat ranked fifth among the leading causes of unintentional injury death for middle-aged adults 45-64 years old (**Figure 2-15, Table 2-8**), but it did not rank in the top five for any other age group. In 1994-2004, 109 middle-aged adults died from *exposure to excessive natural heat*, twice the number of those who died from *exposure to excessive natural cold* (57, **Table 2-8**).

During 1994-2004, the average annual mortality rate for drug overdoses (10.5 deaths per 100,000 middle-aged adults) was the second highest rate among the age groups.

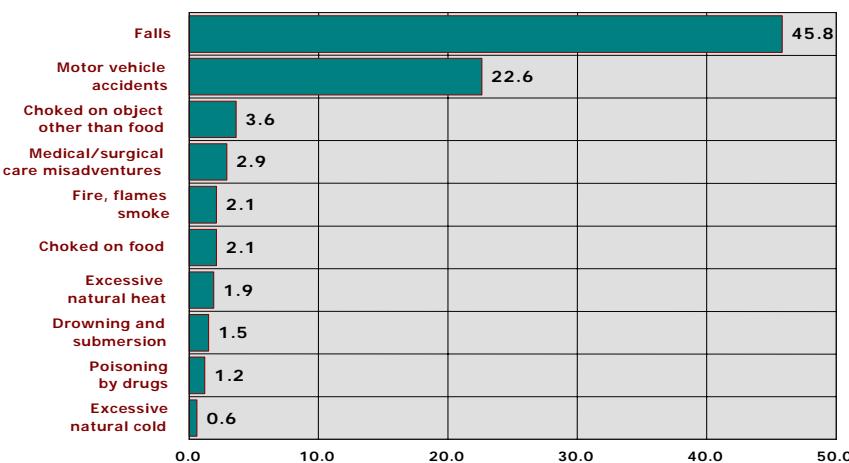

During 1994-2004, *falls* were the leading cause of unintentional injury death among elderly 65 years or older (**Figure 2-16, Table 2-9**). The number of deaths from *falls* more than doubled among elderly Arizonans from 203 in 1994 to 460 in 2004. Deaths due to *exposure to fire, flames and/or smoke* ranked fifth among the leading causes of accidental death for this age group. Both *excessive natural heat* (145 deaths in 1994-2004) and *excessive natural cold* (43 deaths in 1994-2004) were among the top 10 causes of unintentional injury mortality of the elderly Arizonans 65 years or older.

Figure 2-15
Average Annual* Mortality Rates for Leading Causes of Accidental (unintentional) Injury Among Middle-Aged Adults (45-64 years old), 1994-2004

*Number of deaths from specified cause per 100,000 population per year from 1994 to 2004. The rates were computed using an 11-year total number of deaths for 1994-2004. The 1999 population figures (i.e., population at mid-point) multiplied by eleven were used as the denominators.

Figure 2-16
Average Annual* Mortality Rates for Leading Causes of Accidental (unintentional) Injury Among Elderly (65 years and older), 1994-2004

*Number of deaths from specified cause per 100,000 population per year from 1994 to 2004. The rates were computed using an 11-year total number of deaths for 1994-2004. The 1999 population figures (i.e., population at mid-point) multiplied by eleven were used as the denominators.

ACCIDENTAL (UNINTENTIONAL INJURY) DEATHS, ARIZONA, 1994-2004

KEY FINDINGS

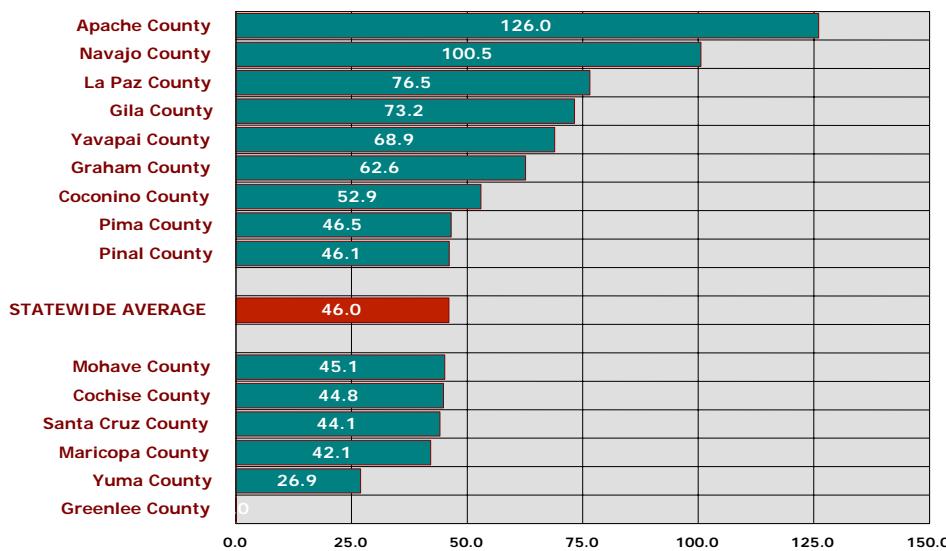

Figure 2-17
Comparison of Average Annual* Mortality Rates for the
Five Leading Causes of Accidental (unintentional) Injury
by Age Group, Arizona, 1994-2004

Rank	Children 1-14 years old	Adolescents 15-19 years old	Young Adults 20-44 years old	Middle-Aged Adults 45-64 years old	Elderly 65 years or older
1	Motor vehicle accident 6.4	Motor vehicle accident 30.9	Motor vehicle accident 25.1	Motor vehicle accident 19.5	Falls 45.8
2	Drowning 2.8	Poisoning by drugs 2.1	Poisoning by drugs 12.4	Poisoning by drugs 10.5	Motor vehicle accident 22.6
3	Fire, flames smoke 0.7	Drowning 1.7	Drowning 1.6	Fall 3.5	Choked on objects other than food 3.6
4	Mechanical suffocation 0.3	Accidental discharge of firearms 0.8	Falls 1.3	Drowning 1.5	Medical/surgical care mis-adventures 2.9
5	Accidental discharge of firearms 0.2	Falls 0.7	Poisoning by gases and vapors 0.6	Excessive natural heat 1.0	Fire, flames smoke 2.1

Number of deaths from specified cause per 100,000 population per year from 1994 to 2004. The rates were computed using an 11-year total number of deaths for 1994-2004. The 1999 population figures (i.e., population at mid-point) multiplied by eleven were used as the denominators.

Figure 2-17 shows variation across age groups in the five leading causes of unintentional injury mortality. The age groups share most of the leading causes in common (*motor vehicle accidents, poisoning by drugs, drowning, and falls*). For children 1-14 years old, deaths due to *mechanical suffocation* ranked fourth, but they were not ranked in the top 5 for any other age group. Deaths due to *excessive natural heat* ranked fifth for the middle-aged adults 45-64 years old, but not ranked in the top 5 for the other age groups.

Figure 2-18
Age-Adjusted Mortality Rates for Accidents (unintentional)
Injury by County of Residence in Arizona, 2004

Number of deaths from unintentional injuries (accidents) per 100,000 population age-adjusted to the 2000 U.S. standard.

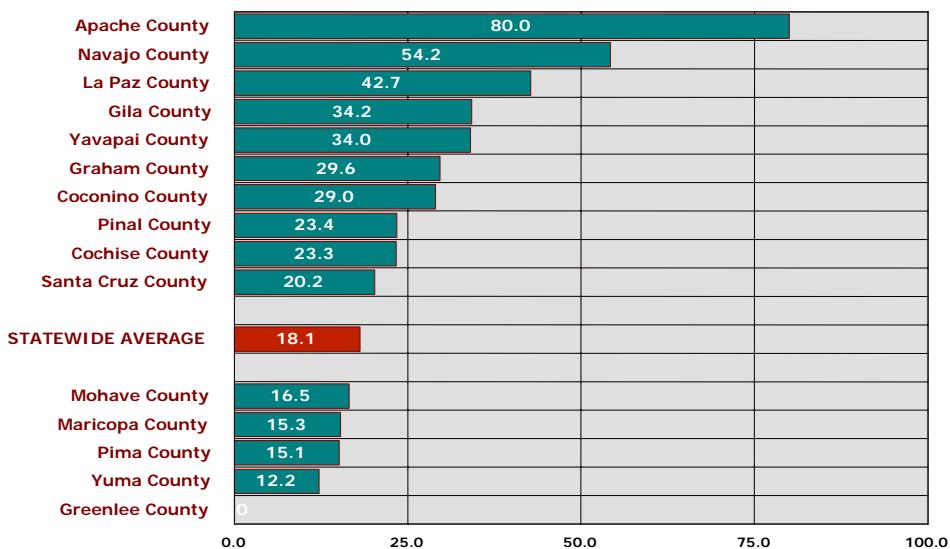

In 2004, the age-adjusted mortality rates for all accidents ranged from a low of 26.9/100,000 in Yuma County to a high of 126.0/100,000 in Apache County (**Figure 2-18**). Nine among Arizona's fifteen counties exceeded the statewide average rate of 46.0 deaths per 100,000 age-adjusted population. There were no deaths from unintentional injuries in Greenlee County.

ACCIDENTAL (UNINTENTIONAL INJURY) DEATHS, ARIZONA, 1994-2004

KEY FINDINGS

No resident of Greenlee County died in 2004 in a motor vehicle accident. In 2004, as in the past, the residents of the metropolitan areas of Phoenix (Maricopa County), Tucson (Pima County) and Yuma (Yuma County, **Figure 2-19**) had the lowest age-adjusted mortality rates for motor vehicle accidents. The residents of the rural counties of Apache, Navajo and La Paz had the highest mortality risk for motor vehicle accidents.

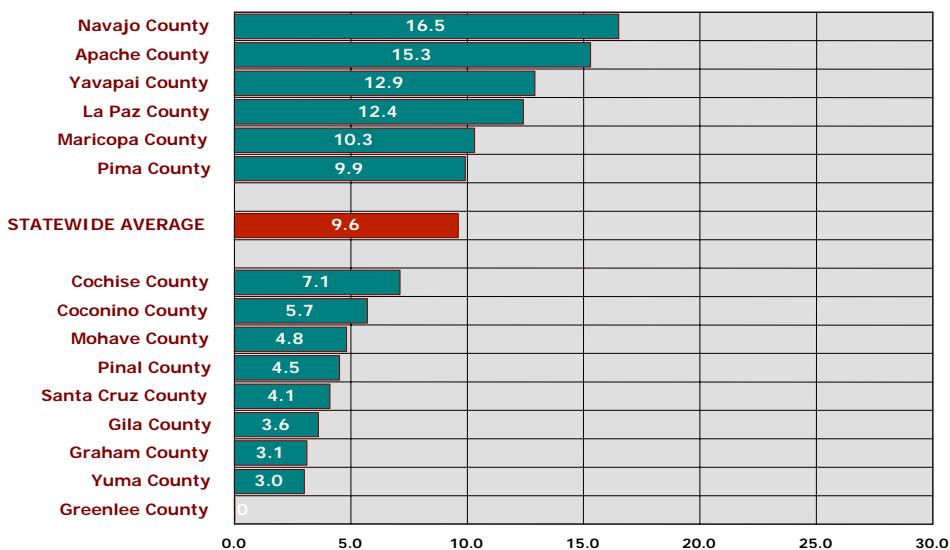

Figure 2-19
Age-Adjusted Mortality Rates for Motor Vehicle Accidents
by County of Residence in Arizona, 2004

Number of deaths from motor vehicle accidents per 100,000 population age-adjusted to the 2000 U.S. standard.

The age-adjusted mortality rates for falls varied in Arizona in 2004 from zero no fatalities in Greenlee County to 16.5 deaths per 100,000 residents of Navajo County.

Figure 2-20
Age-Adjusted Mortality Rates for Accidental Falls
by County of Residence in Arizona, 2004

Number of deaths from falls per 100,000 population age-adjusted to the 2000 U.S. standard.

TABLE 2-1
ACCIDENTAL (UNINTENTIONAL INJURY) DEATHS BY YEAR AMONG ARIZONA RESIDENTS, 1994-2004

	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004

ACCIDENTAL (UNINTENTIONAL INJURY) DEATHS, ARIZONA, 1994-2004

Technical Notes

Beginning with the 2000 data year in Arizona (1999 nationally) two major changes have occurred that affect the computation of mortality rates and analyses of mortality data over time. First, a new revision of the International Classification of Diseases (ICD), used to classify causes of death, was implemented. The Tenth Revision (ICD-10) has replaced the Ninth Revision (ICD-9), which was in effect since 1979. Second, a new population standard for the age adjustment of mortality rates has replaced the standard based on the 1940 population and used since 1943. The new set of age-adjustment weights uses the year 2000 U.S. population as a standard.

Both changes have profound effects on the comparability of mortality data and continuity in statistical trends. Age-adjusted rates can only be compared to other age-adjusted rates that use the same population standard. In this report, ALL age-adjusted mortality rates are based on the (new) 2000 standard, and they CANNOT BE compared to rates using the 1940 standard population. This is because the age structures of the 1940 and year 2000 populations differ. From 1940 to 2000 the U.S. population "aged" considerably. The age-adjusted rates based on the year 2000 standard are different because the year 2000 population standard, which has an older age structure, gives more weight than the 1940 standard to death rates at older ages where mortality is higher.

Breaks in comparability of mortality statistics effective with deaths occurring in 2000 also result from the implementation of ICD-10. ICD-10 is far more detailed than ICD-9, with about 8,000 categories compared with about 5,000 categories. Some of the coding rules and rules for selecting the underlying cause of death have been changed. Fortunately, the comparability ratio for accidental (unintentional injury) deaths (a measure of comparison between ICD-9 and ICD-10) is close to 1.0 (1.0305), and this indicates that similar number of deaths would be assigned to unintentional injury when ICD-9 or ICD-10 was used.

However, before data for 2000, mortality medical information was based on manual coding of an underlying death for each certificate in accordance with WHO rules, and done locally by the Office of Vital Records. Effective with the 2000 data year and the implementation of ICD-10, cause-of-death data presented in this publication were coded by the National Center for Health Statistics, using computerized procedures of SuperMICAR (Mortality Medical Indexing and Retrieval) and ACME (Automated Classification of Medical Entities) systems.

The conversion to computerized coding contributed to at least some of the breaks in comparability over time of cause-of-death statistics for intentional self-harm (suicide), accidental drug overdoses and accidental discharge of firearms:

Data year	1999	2000	2001	2002	2003	2004
Drug-induced deaths	543	331	577	645	646	745
Accidental poisoning/overdose	383	230	414	458	447	517
Suicide	773	737	600	855	807	854
Suicide by firearms	495	486	358	544	476	498
Suicide by drugs	105	59	76	100	93	115
Accidental discharge of firearms	7	11	114	26	13	13

Unprecedented decline in 2001 in the number of suicides and the equally unprecedented increase in the number of firearm deaths classified as accidental obviously are associated. Approximately 100 firearm fatalities, that would have been classified as suicides had the manual coding system been in place, were classified as accidents in 2001 because the "manner of death" was not indicated and the automated coding system defaulted to accidental injury. Computerized coding of the underlying cause of death also affected the number of accidental drug overdoses in 2000, as well as the number of suicides by drug poisoning in both 2000 and 2001.

The true counts of accidental drug poisonings in 2000 and of accidental firearm fatalities in 2001 are not available and they are marked as such in Tables 2-1 – 2-21.

Both the ICD-9 and ICD-10 codes used to identify specific categories of accidental (unintentional) injury deaths are available at <http://www.azdhs.gov/plan/report/im/im01/im00/imcod.pdf>
